## WHAT IS CLAIMED IS:

1. A positioning system for a moveable platform comprising:

an RF reader for receiving coded data from at least one RF tag positioned at a known location;

at least one optical device for capturing an image of a visual cue positioned at a known location;

means for decoding said encoded data;

means for processing said captured image to determine the position of said visual cue; and means for combining said decoded data and said detected visual cue to calculate a position of said moveable platform.

- 2. The apparatus of claim 1 wherein said RF reader and said optical device are affixed to a moveable platform.
- 3. The apparatus of claim 2 wherein said moveable platform is an elevator.
- 4. The apparatus of claim 1 wherein said image is a one dimensional image.
- 5. The apparatus of claim 1 wherein said image is a two dimensional image.
- 6. The apparatus of claim 1 additionally comprising a memory device in which is stored position information of each of said at least one RF tag and each of said at least one visual markers.
- 7. The apparatus of claim 1 additionally comprising an illumination source.
- 8. The apparatus of claim 7 wherein said illumination source comprises an infrared light source and said optical device is an infrared camera.
- 9. The apparatus of claim 7 wherein said illumination source comprises an ultraviolet light source and said optical device is an ultraviolet camera.
- 10. The apparatus of claim 1 wherein said visual cue is a horizontal line.

- 11. The apparatus of claim 1 wherein said means for processing said captured image comprises means for performing sub-pixel image processing.
- 12. A method for determining position comprising the steps of:

  providing a plurality of RF tags at fixed positions;

  providing a plurality of visual markers at fixed positions;

  affixing an RF reader to a moveable platform;

  affixing an optical device to said moveable platform;

  using said RF reader to receive coded information from one of said plurality of RF tags;

  imaging at least one of said plurality of visual markers with said optical device to

  produce an image;

performing image processing on said image to identify a position of a visual cue in said image; and

combining said position of said visual cue with said coded information to determine a location of said moveable platform.

- 13. The method of claim 12 wherein said moveable platform is an elevator.
- 14. The method of claim 12 wherein said performing said image processing comprises performing sub-pixel image processing.
- 15. The method of claim 12 wherein imaging said at least one of said plurality of visual markers comprises capturing a one dimensional image.
- 16. The method of claim 12 wherein imaging said at least one of said plurality of visual markers comprises capturing a two dimensional image.
- 17. The method of claim 12 comprising the steps of:
  storing in a memory device said fixed positions of said plurality of visual markers;
  retrieving at least one of said fixed positions of said plurality of visual markers using said
  received coded information; and

comparing said retrieved at least one of said fixed positions to said position of said visual cue to determine said location of said moveable platform.
